

How CSS Was Applied to the Sweet Bakery Website

External CSS was used to separate the design and styling of the Sweet Bakery website from the HTML structure. A separate file called `style.css` was created. This allows the same styling rules to be applied to all the pages of the website, including the Welcome, Products, About Us, Contact Us and Enquiries pages.

1. Linking the External CSS File

The external stylesheet was connected to each HTML page by adding the following line inside the ``<head>`` section:

```
` `` `html
<link rel="stylesheet" href="style.css">
` `` `
```

The `rel="stylesheet"` attribute tells the browser that the linked file is a CSS stylesheet, while `href="style.css"` specifies the location and name of the CSS file.

Using an external stylesheet means that the same design can be applied to multiple pages without writing the CSS code separately on every page.

2. Styling the Body

The `body` selector was used to control the overall appearance of the webpage.

```
` `` `css
body{
    background-color: #fff8f0;
    font-family: Arial, sans-serif;
    margin: 0;
    padding: 20px;
    text-align: center;
    color: #333333;
}
` `` `
```

The `background-color`` creates a light cream background that gives the bakery website a warm appearance. The `font-family`` changes the text to Arial, which is simple and easy to read. The `margin`` and `padding`` create spacing around the content. The `text-align: center`` centres the main content on the page, while the `color`` changes the default text colour to dark grey.

3. Styling the Main Heading

The `h1`` selector was used to style the main Sweet Bakery heading.

```
```css
h1{
 color: #d2691e;
 font-size: 36px;
 margin-bottom: 20px;
}
```
```

The `color`` property gives the heading an orange-brown colour that matches the bakery theme. The `font-size`` makes the main heading larger so that it is clearly visible. The `margin-bottom`` creates space between the heading and the content below it.

4. Styling Subheadings

The `h2`` selector was used to style headings such as "Welcome to Sweet Bakery", "What We Offer" and "Why Choose Sweet Bakery?"

```
```css
h2{
 color: #8b4513;
 margin-top: 25px;
}
```
```

The brown colour makes the subheadings visually different from the normal paragraphs. The ``margin-top`` adds space before each section, making the webpage easier to read.

5. Styling Paragraphs

The ``p`` selector was used to improve the appearance and readability of the paragraphs.

```
```css
p{
 font-size: 18px;
 line-height: 1.6;
 max-width: 800px;
 margin: 10px auto;
}
```
```

The font size was increased to 18 pixels so that the text is easy to read. The ``line-height`` adds space between lines of text. The ``max-width`` prevents paragraphs from becoming too wide on large screens. The ``margin`` centres the paragraphs and creates spacing between them.

6. Styling the Bakery Logo

The ``img`` selector was used to style the bakery logo.

```
```css
img{
 border-radius: 10px;
 margin-bottom: 10px;
}
```
```

The ``border-radius`` gives the image slightly rounded corners. The ``margin-bottom`` creates space between the logo and the heading below it.

7. Styling the Product List

The ``ul`` selector was used to style the list of products offered by Sweet Bakery.

```
` `` `css
ul{
    display: inline-block;
    text-align: left;
    font-size: 18px;
    line-height: 1.8;
}
` `` `
```

The font size makes the product names easier to read. The ``line-height`` creates space between each item in the list. The list is displayed as an inline block so that it can remain centred on the webpage while the individual list items remain aligned to the left.

8. Styling the Navigation Links

The ``a`` selector was used to style the links connecting the different pages.

```
` `` `css
a{
    color: #c71585;
    text-decoration: none;
    font-weight: bold;
    margin: 0 8px;
}
` `` `
```

The ``color`` changes the links to a pink colour that fits the Sweet Bakery theme. ``text-decoration: none`` removes the default underline. ``font-weight: bold`` makes the navigation links easier to see, while ``margin`` adds space between the links.

9. Adding a Hover Effect

A hover effect was added so that the navigation links change when the mouse pointer is placed over them.

```
```.css

a:hover {

 color: #ff6347;

 text-decoration: underline;

}

```.
```

When the user moves the mouse over a link, its colour changes and an underline appears. This provides visual feedback and makes it clear that the text is clickable.

10. Advantages of Using External CSS

External CSS provides several advantages for the Sweet Bakery website. First, it keeps the HTML code clean because the design instructions are stored separately. Second, the same stylesheet can be used across all the website pages, which creates a consistent appearance. Third, changes can be made more efficiently because editing the `style.css` file can update the design of multiple pages at once. Finally, separating structure from presentation makes the website easier to maintain and modify.

Conclusion

The external CSS was applied to control the colours, fonts, spacing, headings, paragraphs, bakery logo, product list and navigation links of the Sweet Bakery website. The `style.css` file is linked to each HTML page using the `` element. This creates a consistent and professional design across the entire website while keeping the HTML structure separate from the visual styling.
